Chronic kidney disease NHS

Chronic kidney disease is usually caused by other conditions that put a strain on the kidneys. Often it's the result of a combination of different problems. CKD can be caused by: high blood pressure over time, this can put strain on the small blood vessels in the kidneys and stop the kidneys working properly

<http://home.schoolnutritionandfitness.com/Chronic-kidney-disease-NHS.pdf>

Kidney infection Illnesses conditions NHS inform

you have an underlying condition that affects the way your kidneys work, such as polycystic kidney disease or chronic kidney disease; If you're admitted to hospital with a kidney infection, you'll probably be attached to a drip so you can be given fluids to help keep you hydrated. Antibiotics can also be given through the drip.

10 Most Common Chronic Diseases Infographic Healthy

Number 6: Chronic kidney disease (CKD) 18% of older adults were treated for CKD or a slow loss in kidney function over time. People dealing with CKD have an increased risk for developing heart disease or kidney failure. You can do the following to prevent or diminish symptoms of CKD: Understand what damages your kidney.

<http://home.schoolnutritionandfitness.com/10-Most-Common-Chronic-Diseases--Infographic--Healthy--.pdf>

Chronic kidney disease Symptoms NHS

Kidney disease does not tend to cause symptoms when it's at an early stage. This is because the body is usually able to cope with a significant reduction in kidney function. Kidney disease is often only

diagnosed at this stage if a routine test for another condition, such as a blood or urine test, detects a possible problem.
