Oral Controlled Release Drug Delivery System A Review

A desirable characteristic of controlled release delivery system is that the duration of drug action should be dictated by the design property of drug molecules. There are different mechanistic aspects for design of oral controlled release drug delivery systems such as matrix, reservoir, osmotic pressure, ion exchange resins, altered density etc.

Design and evaluation of controlled drug delivery system

1. Introduction. The efficiency of a drug lies in targeting specific parts and maintaining its desired concentration for longer period of time. By designing controlled delivery system, the desired concentration of drug can be maintained without reaching a higher toxic level or dropping below the minimum effective level , , . The various biocompatible and biodegradable synthetic and natural

Controlled Release Drug Delivery Systems

Controlled Drug Delivery (CDD) occurs when a polymer, whether natural or synthetic, is judiciously combined with a drug or other active agent in such a way that the active agent is released from the

material in a predesigned manner. The release of the active agent may be constant over a long period, it may be cyclic over

Controlled Release Matrix Tablets of Zidovudine Effect of

Controlled release (CR) tablet formulations are much desirable and preferred for such therapy because they offer better patient compliance, maintain uniform drug levels, reduce dose and side effects and increase safety margin of high-potency drugs . Several polymers have been used in the formulation of matrix based CR drug delivery systems.
