Acanthaceae plant family Britannica

Acanthaceae, one of 24 families in the mint order of flowering plants, containing approximately 220 genera and nearly 4,000 species distributed predominantly in tropical and subtropical regions of the world. The greater part of the Acanthaceae family are herbs or shrubs, but vines and trees occur as well.

<http://home.schoolnutritionandfitness.com/Acanthaceae-plant-family-Britannica.pdf>

Acanthaceae Wikipedia

Acanthaceae is a family (the acanthus family) of dicotyledonous flowering plants containing almost 250 genera and about 2500 species. Most are tropical herbs, shrubs, or twining vines; some are epiphytes. Only a few species are distributed in temperate regions. The four main centres of distribution are Indonesia and Malaysia, Africa, Brazil, and Central America.

Flora Kerala

The endemic flora in Kerala is mainly palaeotropic in composition, which is a part of the peninsular Indian endemic flora of Gondwanaland origin. Though there are common elements, the characteristic endemic flora of Kerala and Sri Lanka was developed from a common stock, but isolated due to temporal or geographical barriers.

Census of Endemic Flowering Plants of Kerala India

Kerala s coast runs for some 580 km, while state itself varies between 35 to 120 km in width. It lies near the center of Indian tectonic plate, as such most of the state is subject to comparatively little seismic and volcanic activity. Geographically, Pre-Cambrian and Pleistocene formations comprise the bulk of Kerala s terrain.

Global warming and South Indian monsoon rainfall lessons

The studied outcrop is located in the Kerala Basin (SW-India) at the coastal cliffs at Varkala (). It exposes a 21-m-thick siliciclastic succession of the Ambalapuzha Formation conformably overlying carbonates of the Quilon Formation (Vaidyanadhan and Ramakrishnan, 2008). Elevation and denudation of the Western Ghats were the source for the siliciclastics (Campanile et al., 2008).
